Credit Card Framework Enhancement Overview

Credit card service provider market is very fragmented, and the usage differs by geography and industry. Every service provider has its own requirements and there is no uniformity in their stipulated methods. The vision of Payments is to provide a configurable framework for credit card processing that facilitates integration with service provider of choice. Its flexible configuration allows integration with several service providers; this is primarily beneficial for industry vertical applications such as Student Cloud, Public Sector Cloud, and Learning Cloud. It also paves the way to provide a long-term sustainable model for supporting multiple service providers.

PCI Compliance Applicability

This standardized infrastructure itself is certified to meet PCI DSS requirements such that onboarding a payment service provider doesn't need a separate PCI audit. This infrastructure can be enhanced to support plug-and-play model where customers can integrate the payment service provider of their choice and assume responsibility for ensuring the service provider's PCI compliance.

Credit Card Service Provider Compatibility Criteria

Payments already provides ready-to-use integrations with 2 leading payment service providers, CyberSource (owned by Visa) and Fiserv SnapPay.

To standardise the token creation and transaction processing based on the various flows within Oracle Fusion Cloud Applications Suite, we have described the following prerequisites that a service provider needs to adhere to for integration with Payments.

Baseline Expectations

- a. Token creation should be supported using a hosted payment page (HPP). Application launches the HPP URL with the required request body inside an iFrame using a form post on client side.

```

var newForm =
ifrmHop.contentWindow.document.createElement("form");

newForm.setAttribute("method", "POST");
newForm.setAttribute("action", tkURL);
newForm.setAttribute("target", "_self");
newForm.setAttribute("name", "hopConnect");

//var tkReqBody = tokenizeButton.getProperty("tkReqBody");
var tkPairs = tkReqBody.split("&");
for (j=0; tkPairs.length > j; j++) {
var tkField = tkPairs[j].split("=");
var formField = document.createElement("input");
formField.setAttribute("type", "hidden");
formField.setAttribute("name", tkField[0]);
formField.setAttribute("value", decodeURIComponent(tkField[1]));

newForm.appendChild(formField);
}
//document.body.appendChild(newForm);
ifrmHop.contentWindow.document.body.appendChild(newForm);
finPmtFCCreditCardHosted.redirDone = true;
newForm.submit();

```

- b. Service provider should initiate action (token, authorization, or authorization and settlement) based on an attribute passed in the HPP launch request rather than expecting another call to perform the same.

Note: HPP URL should accept a transaction type kind of attribute, where the type of transaction can be sent in request body. Also, a single API is preferred for performing authorization, settlement, and refund on saved card, based on a similar transaction type kind of attribute in request body.

For example,
 TransactionType=token (or)
 TransactionType=authorization (i.e., token + authorization) (or)
 TransactionType=sale (i.e., token + authorization + sale)

- c. Service provider should support the following types of transactions:
- Token-only creation (using HPP)
 - Token creation and authorization in a single request (using HPP)
 - Token creation and authorization and capture in a single request (using HPP)
 - Authorization on existing saved card in Payments
 - Settlement and refund (Partial, Full, or Multiple) transactions

- d. The hosted payment page should be rendered in card information capture mode and no payment method selection should be provided to user.
- e. Every API should accept merchant-defined custom attributes to send application related information like source transaction identifiers, or other identifiers from source product.

```
Merchant_defined_data1=204
Mercahnt_defined_data2=300010002300123
....
```

- f. Service provider should provide a client-side form post back response when the user creates a token or makes a payment using the hosted payment page. There shouldn't be any need to perform a separate GET call for getting the response.

Note: Once the service provider's HPP is launched, there is no control for the application to know if the user has completed the payment on HPP. The application initiates a poll along with launching HPP, to check Payments tables if data is registered via the client side post back response. This polling happens continuously and once it sees registered data, application closes the iframe.

```
<form id="custom_redirect" action="https://fuscofmsmc57-fa-
ext.us.oracle.com:443/fscmUI/faces/adf.task-
flow?adf.tflId=AuthorizationHostedReturnFlow&adf.tfDoc=/WE
B-
INF/oracle/apps/financials/payments/fundsCapture/transactions/
ui/flow/AuthorizationHostedReturnFlow.xml" accept-
charset="UTF-8" method="post"><input name="utf8"
type="hidden" value="#x2713;" />
  <input type="hidden" name="accountid"
value="1000493269" />
  <input type="hidden" name="customerid"
value="100000015406339" />
  <input type="hidden" name="paymentmode" value="CC"
/>
...
</form><script type="text/javascript">
  window.onload = function(){
    document.forms['custom_redirect'].submit();
  }
</script>
```

- g. There shouldn't be any need to uptake any SDK/libraries of service provider for launching the HPP or for performing any operation to make it plug-n-play.

Note: Importing third-party java script libraries to launch HPP is strictly not recommended by the SaaS Product Security Team. Also, any SDK dependency stops the architecture from supporting plug-n-play and

makes it a requirement to package the SDK in application for every payment gateway.

- h. The message attribute signing (if required by service provider) should be based on Hash-based Message Authentication Code (HMAC) where a secret key is generated by service provider and stored within Payments setup.

Supported ones are:

- HmacSHA256
 - HmacSHA224
 - HmacSHA384
 - HmacSHA512
- i. Service provider should provide a definite response codes and mappings for success/failure scenarios.

```
<xsl:choose>
  <xsl:when test="$rc = 100">Successful
transaction.</xsl:when>
  <xsl:when test="$rc = 101">The request is missing one or
more required fields.</xsl:when>
  <xsl:when test="$rc = 102">One or more fields in the
request contains invalid data.</xsl:when>
  <xsl:when test="$rc = 110">Only a partial amount was
approved.</xsl:when>
  ...

```

Additional Expectations

- Secured capture of CVV for card-on-file transactions should be supported via tokenization of CVV.

Example

```
Js : microform = flex.microform({ styles: myStyles });
Html : <div id="securityCode-container"/>
```

- Transaction query should be supported using merchant-defined custom attributes.
- Two-factor authentication should be supported via HPP without any additional development work. This is needed for EU PSD2 requirements compliance.

Note: The authentication should be controlled from merchant portal config. There shouldn't be any change in the integration.

- Level II and Level III information should be captured in a uniform manner without expecting merchant to pass processor or brand-specific details.

Prerequisites to Enable Credit Card Payment Processing

To enable the credit card payment processing feature in an environment, following mandatory prerequisites must be met:

1. Environment (POD) should be hosted in one of the following 17 PCI certified OCI regions:
 1. US-Phoenix-1
 2. UK-London-1
 3. CA-Toronto-1
 4. EU-Frankfurt-1
 5. US-Ashburn-1
 6. AP-Mumbai-1
 7. EU-Zurich-1
 8. SA-Saopaulo-1
 9. AP-Sydney-1
 10. AP-Osaka-1
 11. EU-Amsterdam-1
 12. ME-Jeddah-1
 13. AP-Tokyo-1
 14. AP-Melbourne-1
 15. ME-Dubai-1
 16. CA-Montreal-1
 17. AP-Hyderabad-1
2. A PCI-compliant Identity Management (IDM) solution must be provided by the customer. Use of the default Fusion Apps IDM solution is not allowed at this time. Some commonly used IDM solutions are Oracle Identity Cloud Service (IDCS), Okta, Azure Active Directory, and so on. This identity management solution is used for multi-factor authentication for payment administrator user who perform credit card related setups in Fusion Applications.
3. There're no planned integrations with Oracle PaaS or any on-premises software that involve credit card data or credit card processing. If you have integration from Fusion Application to Oracle PaaS, none of the integrations should involve credit card or token data movement.
4. If you wish to enable credit card payment processing and meet these requirements, please log a service request with Oracle Fusion Payments Cloud Service product support and provide the following details:
 1. Product: Oracle Fusion Payments Cloud Service
 2. Title/Description: Enable credit card payment processing in POD(s) <list the POD names here>
 3. Complete the [Credit Card Prerequisites Template](#) and upload to the service request. Respond to each question in as much detail as possible.
5. Once the service request is approved, a Credit Card Secret Key will be shared to you. Use this key in the Credit Card Feature Lookup section.

New Credit Card Service Provider On-boarding

This section describes the various setups required to onboard a payment gateway for accepting credit card payments.

As an example, the CyberSource configuration is described in this document. You can follow similar steps to configure any other payment gateways that may be supported in future.

Note: The common architecture of Oracle Fusion Payments module lets you integrate with the payment gateway of your choice, provided it meets the criteria listed in the Credit Card Service Provider Compatibility Criteria section in this document. While choosing the payment gateway for credit card tokenization and payment processing, you must ensure the following:

1. The payment gateway provides a tokenization scheme where the original PAN (credit card number) can't be computed simply by knowing only the token or several tokens.
2. The PAN (credit card number) and the Sensitive Authentication Data (SAD) must not be transmitted back to Oracle.
3. The credit card data entry page of the payment gateway must be encapsulated in an iframe so that the entered credit card data never comes in direct contact with the Oracle systems.

Credit Card Feature Lookup

Follow these steps to enable the credit card feature in your environment:

1. In the Setup and Maintenance work area, go to the **Manage Standard Lookups** task.
 - Offering: Financials
 - Functional Area: Customer Payments
 - Task: Manage Standard Lookups
2. Create a Lookup Type with the following details:
 - Lookup Type: **IBY_TIME_BOUND_SWITCH**
 - Meaning: **Time bound switch to enable credit card feature**
 - Description: **Time bound switch to enable credit card feature.**
 - Module: **Payments**

Search Results

Actions View Format + X P Freeze Detach Wrap

Lookup Type	Meaning	Description	Module	Lookup Configuration Level	REST Access Secured
IBY_TIME_BOUND_SWIT	Time bound switch to enable credit card feat	Time bound switch to enable credit card feat	Payments	User	Secure

3. For the lookup type IBY_TIME_BOUND_SWITCH that you just created, create a lookup code with the following details:
 - Lookup Code: **IBY**
 - Meaning: **Credit Card Secret Key shared by Oracle Support Team**
 - Description: **Credit Card Secret Key shared by Oracle Support Team.**
 - Enabled: Select the check box.

Search Results

Credit Card Common Architecture Lookup

By default, the Common Architecture feature is disabled. You can enable this feature using a predefined lookup code. Details of the lookup are as follows:

- Lookup Type: **ORA_IBY_CONTROLLED_FEATURES**
- Lookup Code: **IBY_FEATURE_GEN_ARCH**

Follow these steps to enable the credit card common architecture:

- In the Setup and Maintenance work area, go to the **Manage Standard Lookups** task.
 - Offering: Financials
 - Functional Area: Customer Payments
 - Task: Manage Standard Lookups
- Search for the lookup type **ORA_IBY_CONTROLLED_FEATURES**.

Funds Capture Payment Methods

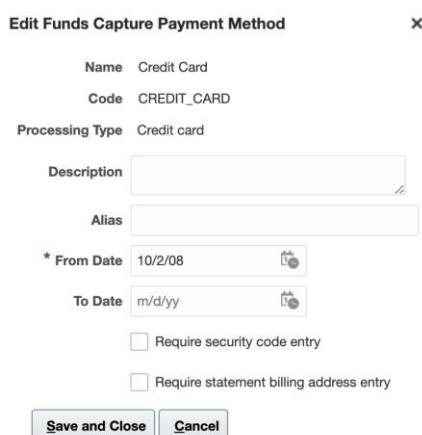

Ensure that the credit card is available in the list of payment methods on the **Manage Funds Capture Payment Methods** page.

- In the Setup and Maintenance work area, go to **Manage Funds Capture Payment Methods** task
 - Offering: Financials
 - Functional Area: Customer Payments
 - Task: Manage Funds Capture Payment Methods
- Check if **Credit Card** payment method is available as shown in the following screenshot.

Name	Code	Processing Type	Description
Bank Account Transfer	BANK_ACCT_XFER	Bank account	Bank Account Transfer-Description
Bills Receivable	BILLS_RECEIVABLE	Bank account

Save and Close **Cancel**

- Ensure that the following fields and the corresponding values are present.
 - Select **Credit card** as **Processing Type**.
 - Deselect the **Require security code entry** check box.
 - Deselect the **Require statement billing address entry** check box.
 - Don't select the **To Date**. This ensures that the payment isn't end dated.
- Click **Save and Close**.

Funds Capture Formats

There are 4 types of Funds Capture Formats that are essential for a credit card transaction flow. Each format corresponds to a particular credit card transaction type (which has an outbound request and an inbound response). This tables describes the transaction types, and their corresponding funds capture formats.

TRANSACTION TYPE	REQUEST/ RESPONSE TYPE	FUNDS CAPTURE FORMAT TYPE	DESCRIPTION
Card Tokenization	Outbound request	Funds Capture Card Tokenization Request Formats	The request sent to the payment gateway to launch the HPP where user can enter the card details. The funds capture format type specifies the required parameters for this outbound call.
Card Tokenization	Inbound response	Funds Capture Card Tokenization Request Response Formats	The response sent by the payment gateway for the outbound card tokenization request. The funds capture format type specifies the parameters to be saved from this inbound call.
Authorization/ Settlement/ Refund	Outbound request	Funds Capture Card-On-File Request Formats	The request sent to the payment gateway to perform authorization/settlement/refund transactions. The funds capture format type specifies the required parameters for this outbound call.
Authorization/ Settlement/ Refund	Inbound response	Funds Capture Online Response Formats	The response sent by the payment gateway for the outbound authorization/settlement/refund request. The funds capture format type specifies the parameters to be saved from this inbound call.
Transaction Query	Outbound request	Funds Capture Transaction Query Request Formats	The request sent to the payment gateway to fetch the transaction status. The funds capture format type specifies the required parameters for this outbound call.
Transaction Query	Inbound response	Funds Capture Transaction Query Response Formats	The response sent by the payment gateway for the outbound transaction query request. The funds capture format type specifies the parameters to be saved from this inbound call.

For each of these format types, you must create a format based on the Service Provider's specifications. The formats required for CyberSource payment system are predefined in the system. To create custom formats for a new service provider, refer to the Payment Gateway Integration and Credit Card Processing – Technical Specifications document.

To illustrate this setup, the formats available for CyberSource are shown in this document. For a new service provider, create custom formats based on the service provider's specifications.

Note: These formats should be attached to the payment system in appropriate locations. Refer to section namely **Payment System - CyberSource Setup** for details on configuring these formats within the CyberSource payment system.

1. In the **Setup and Maintenance** work area, go to the **Manage Formats** task.
 - Offering: Financials

- Functional Area: Customer Payments
- Task: Manage Formats

2. Ensure that the following formats are available in the system.

You can design custom formats to suit the requirements of a new payment system. Follow these steps to create a custom format:

1. Navigate to the **Manage Formats** setup page.

Note: Steps required to navigate to a setup page are provided in the **Funds Capture Payment Methods** section of this document.

2. Select the format type of the custom format and click **Create**.

View Freeze Wrap Select Type Funds Capture Card Tokenization Request Formats **Create** View Available Format Types

3. Enter these format details in the **Create Format** page.

- **Name:** Name of the format
- **From Date:** Date from which the format would be valid
- **Code:** Identifier of the format
- **To Date:** Expiry date of the format
- **Type:** Format type
- **Message Direction:** Inbound/Outbound
- **Payload Type:** Payload type can JSON, Text, or XML.
- **Choose file:** Select and upload custom format. Refer to the Payment Gateway Integration and Credit Card Processing – Technical Specifications document for details on what to include in the template.

4. Click **Save and Close**.

Transmission Configurations

A transmission configuration contains the transmission details specific to a payment system or a financial institution.

Two transmission configurations should be configured for CyberSource as follows:

1. CyberSource COF: This is required for Authorization/Settlement/Refund transactions.
2. CyberSource Query: This is required for querying the transaction status.

Refer to the Payment Gateway Integration and Credit Card Processing – Technical Specifications document for details on how to create a custom Transmission Configuration for a new service provider.

CyberSource COF: Here are the steps required to set up CyberSource COF transmission configuration:

1. In the Setup and Maintenance work area, go to the Manage Transmission Configurations task.
 - Offering: Financials
 - Functional Area: Customer Payments
 - Task: Manage Transmission Configurations
2. Create a new transmission configuration with these details:
 - Configuration: Name of the transmission configuration (CyberSource COF)
 - Protocol: Http(s) POST Request
 - Destination URL: Provided by CyberSource directly to the Customer post account creation with CyberSource.
 - Send Body Content Type: text/xml
 - Receive Body Content Type: text/xml

Setup in Service Provider's Portal

A merchant might have to perform a few setup steps in the service provider's portal to start accepting credit card payments. The exact steps depend on the service provider chosen by the merchant. For illustration purposes, the setup steps for CyberSource's merchant portal are given in this document. For any other service provider, reach out to their implementation/support team for the exact steps to be performed.

CyberSource Business Center Setup

CyberSource Business Center is a secure, web-based interface for managing and configuring payment processing services. To avail tokenization and credit card payment services, you must create a 'Profile' in Business Center. To create a new profile, follow these steps.

- Sign in to CyberSource Business Center.

Note: Login URL and the required credentials are provided by CyberSource directly to the Customer.

- Navigate to **Payment Configuration > Secure Acceptance Settings**. All existing profiles are displayed.

On the left is a navigation menu with options like Transaction Management, Token Management, Device Management, Tools, Reports, Analytics, and Payment Configuration. The main area is titled 'Payment Configuration Secure Acceptance Settings' and shows '156 results with filters: Name: All Profiles'. Below this, there are tabs for 'ACTIVE PROFILES' and 'INACTIVE PROFILES'. The 'ACTIVE PROFILES' tab is selected, displaying a 'Profile List' table. The table has two columns: 'Profile Name' and 'Profile Description'. It lists four profiles: 'ARB Dev Testing slc08vpy VM', '13.17.08 sandbox', '13.17.08A CDRM DIT Enviro...', and '13.17.11B (on V2MIB)-smc166'. A 'NEW PROFILE' button is visible in the top right of the profile list area.

- Enter a name and description for the new copied profile and click **Submit**.

The screenshot shows a 'Copy Profile' dialog box. At the top, it says '× Copy Profile' with a 'Help' icon. Below, there are two input fields: 'Profile Name *' with the text 'Payments Testing' and 'Profile Description' with the text 'Profile for testing Cybersource'. The dialog box has a dark blue header and a light blue body.

The new profile will be created, and it will be available in an Editable Version mode.

The screenshot shows the 'Edit Profile' page in CyberSource. The page title is 'Secure Acceptance Edit Profile' with a 'BACK TO PROFILES' button. Below the title, there's a box containing the profile name 'Test Profile Cybersource Setup' and the profile ID 'CDEC2E5A-05A7-4000-B22E-E067472A9651'. To the right of the profile name, there's a label '(Editable version)'. Below this, there are tabs for 'GENERAL SETTINGS', 'PAYMENT SETTINGS *', 'SECURITY *', 'PAYMENT FORM', and 'NOTIFICATION'. The 'GENERAL SETTINGS' tab is selected, showing 'Profile Information' with fields for 'Profile Name *' (Test Profile Cybersource Setup), 'Profile Description' (Profile used for HOP in Payments), and 'Integration Methods *'.

- Click **Payment Settings** to navigate to the Payment Settings tab.
- Click **ADD CARD TYPES** to select the card types to accepted in the hosted payment page.

9. Click **Customer Response** link and navigate to **Transaction Response Page**. Select **Hosted by you** option and enter any dummy URL.

The screenshot shows the 'Transaction Response Page' configuration page. On the left is a sidebar with icons for settings, documents, and reports. The main content area has a title 'Transaction Response Page' with an information icon. Below the title are two radio button options: 'Hosted By CyberSource' (unselected) and 'Hosted By You' (selected). Below these options is a text field for 'URL' containing 'https://fuscofmsmc21-fa-ext.us.orac'. There is also a section for 'Transaction Response Message' and a 'Decline Limit' dropdown menu.

10. Repeat the previous step and enter the same URL in **Custom Cancel Response Page**.

The screenshot shows the 'Custom Cancel Response Page' configuration page. It has a similar layout to the previous page, with a title 'Custom Cancel Response Page' and two radio button options: 'Hosted By CyberSource' (unselected) and 'Hosted By You' (selected). The 'URL' field contains the same dummy URL 'https://fuscofmsmc21-fa-ext.us.orac'. At the bottom right, there is a blue 'SAVE' button.

11. Click **Security** link. Create a new key by clicking the **+** icon.

The screenshot shows the CyberSource 'Security Keys' management page. The top navigation bar includes 'GENERAL SETTINGS', 'PAYMENT SETTINGS *', 'SECURITY *', 'PAYMENT FORM', 'NOTIFICATIONS', and 'CUSTOMER RESPONSE*'. The 'SECURITY *' tab is active. Below the navigation bar, there are tabs for 'ACTIVE KEYS' and 'INACTIVE KEYS'. A 'Create Key' button is highlighted with a red box. Below the tabs is a table with the header 'Keys'. To the right of the table, there is a '+' icon, also highlighted with a red box.

12. Provide the **Key Name**. **Signature version** and **Signature Method** are set by default. Click **Create**.

The screenshot shows the 'Security Keys' 'Key Creation' dialog. It has a title bar with a close button and a 'Help' link. Below the title bar, there are 'CANCEL' and 'CREATE' buttons. The 'CREATE' button is highlighted with a red box. Below the buttons, there are three input fields: 'Key Name' with the value 'NKCYBTest', 'Signature Version' with the value '1', and 'Signature Method' with the value 'HMAC-SHA256'.

Security keys are generated as shown.

Payment System

To integrate with any new service provider, it should be defined as a payment system. The values to be configured under the payment system would be provided by the service provider to the merchant.

CyberSource is predefined as a payment system. The process of configuring a payment system is illustrated in this document by using CyberSource as an example. You can follow similar steps to configure a new service provider as a payment system.

CyberSource Setup

Steps required to configure the CyberSource payment system are described in this section. CyberSource is predefined as a payment system.

1. In the Setup and Maintenance work area, go to the Manage Payment Systems task.
 - Offering: Financials
 - Functional Area: Customer Payments
 - Task: Manage Payment Systems
2. Search by name for **CyberSource**. Click **CyberSource** link from the search results to navigate to **Edit Payment System** page.

Manage Payment Systems

Funds Capture Process Profile

A funds capture process profile (FCPP) is a key setup entity that contains all the rules necessary for processing funds capture transactions. It tells Oracle Fusion Payments how to communicate with a specific payment system and includes the payment system accounts to be used for processing transactions.

An FCPP (CyberSource SOAP Toolkit 1.86) is predefined for CyberSource. The process of configuring an FCPP is illustrated using CyberSource as an example. You can follow similar steps to create a new FCPP for a new service provider.

CyberSource Funds Capture Process Profile

1. Click **Navigator > My Enterprise > Setup and Maintenance**.
2. In the Setup and Maintenance work area, go to the **Manage Funds Capture Process Profiles** task:
 - Offering: Financials
 - Functional Area: Customer Payments
 - Task: Manage Funds Capture Process Profile
3. Search by name for **CyberSource SOAP Toolkit 1.86** as shown here.

Internal Payee Setup

You can create an internal payee and set up and assign routing rules. The routing rules specify which payment system account a transaction is transmitted to, based on the values of various attributes of that transaction.

The process of creating an internal payee and the corresponding routing rules is illustrated using CyberSource as an example. You can follow similar steps for any new service provider.

1. Click **Navigator > My Enterprise > Setup and Maintenance**.
2. In the Setup and Maintenance work area, go to the **Manage Internal Payees** task.
 - Offering: Financials
 - Functional Area: Customer Payments
 - Task: Manage Internal Payees
3. Click on the **Create** icon to create a new payee as shown.
 - a. Enter the Payee details.
 - b. Select **Credit card** check box under Configured Processing Types section.

Payee Routing Rule Setup

This is an optional setup required only in case of multiple business units, CyberSource accounts, and so on, to ensure that payments are routed to the correct CyberSource merchant ID (MID) and profile. For a simple setup with just one business unit, one CyberSource MID and profile, no routing is required. To create a routing rule, select the payee and click **Manage Routing Rule**.

Payee	Code
Vision.com	Vision Corporation
Vision Corporation	vision
Vision Online	1234

The Manage Routing Rules page has default routing rules which apply when no routing rule is specified, or when none of the routing rule conditions were met.

On the same page, you can also define the routing rules with specific conditions and routing rules.

Routing Rules					
View + Reorder Priority	Freeze	Wrap	Payment Method	Credit Card	Create
Priori	Routing Rule Name	Payment Method	Payment System	Funds Capture Process Profile	Status
1	CC > 0	Credit Card	oraclepayments	CyberSource SOAP Toolkit 1.86 oraclepayments	Active

To create a routing rule, follow these steps:

1. Select Credit Card as Payment Method and then click Create.
2. Enter the following details to create a routing rule that sends any payment with amount between \$501-\$1000 to CyberSource 'oraclepayments' MID/payment system account.

Edit Routing Rule

Note: Not all attributes are applicable to Credit Card payment method.

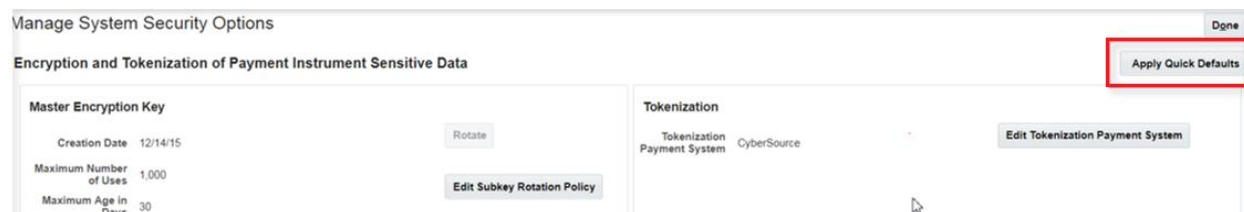

4. Click **Save and Close**.

Enable Tokenization in System Security Options

To secure your credit card data, complete these steps:

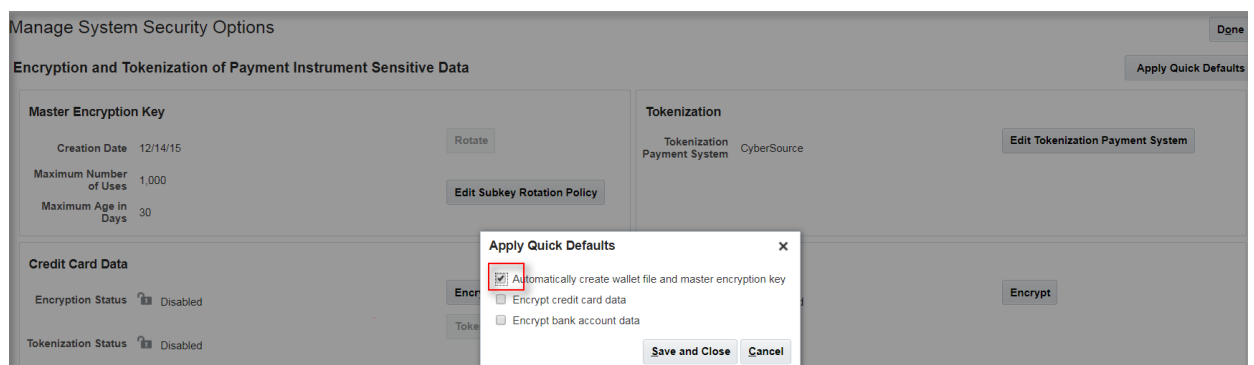

Verify Tokenization Status and Wallet File Setup

- In the Setup and Maintenance work area, go to the Manage System Security Options task.
 - Offering: Financials
 - Functional Area: Customer Payments
 - Task: Manage System Security Options
- Check if **Apply Quick Defaults** button is enabled.

- Click the button if it's enabled. Select all the three check boxes. The first check box is required for the tokenization process. The second and third check boxes (for encrypting credit card data and bank account data, respectively) are recommended as a best practice for securing credit card and bank account data.

Note: The wallet is an Oracle Applications program module that protects stored data in an encrypted format.

- Click **Save and Close**.
- Verify the existing Tokenization Status for the Credit Card data. If the status is either **Tokenized** or **Tokenization in Progress**, it means that the tokenization setup is already done. If the status is **Disabled**, then proceed to the next step.

Enable Tokenization

1. If Tokenization Status is Disabled, then click on Edit Tokenization Payment System. Select CyberSource from drop-down and save.
2. **Credit Card Data:** If the status is **Enabled**, then skip this step. If the status is **Disabled**, click **Tokenize** to activate Tokenization. Verify that the **Tokenization Status** is either **Tokenized** or **Tokenization in Progress**.
3. **Bank Account Data:** If the status is **Enabled**, then skip this step. If the status is **Disabled**, then click **Encrypt** to trigger the process. Verify that the **Encryption Status** is **Enabled**.

The screenshot displays the 'Manage System Security Options' interface in Oracle. The page is titled 'Encryption and Tokenization of Payment Instrument Sensitive Data'. It contains several sections:

- Master Encryption Key:** Shows creation date (6/26/2020), maximum number of uses (1,000), and maximum age in days (30). Buttons for 'Rotate' and 'Edit Subkey Rotation Policy' are present.
- Tokenization:** Shows 'Tokenization Payment System' set to 'CyberSource' (highlighted with a red box). A button for 'Edit Tokenization Payment System' is available.
- Credit Card Data:** Shows 'Encryption Status' as 'Disabled' and 'Tokenization Status' as 'Enabled' (highlighted with a red box). Buttons for 'Encrypt' and 'Detokenize' are present.
- Bank Account Data:** Shows 'Encryption Status' as 'Enabled' (highlighted with a red box). A 'Decrypt' button is present.
- Payment Instrument Masking:** Contains two sections: 'Credit Card Numbers' and 'Bank Account Numbers'. Both show 'Masking Type' as 'Display last digits' and 'Number of Digits to Display' as '4'. Buttons for 'Edit Masking' are present.
- Security Processes:** Includes a 'View' dropdown (set to 'Flat List'), a 'Resubmit' button, a 'Status' dropdown (set to 'All'), and a 'Time Range' dropdown (set to 'Last 72 hours').

Setup Steps for CVV-Enabled Credit Card Transactions (Merchant Initiated)

These steps are specific to CVV-enabled transactions initiated by the merchant with CyberSource.

To capture CVV while making a payment using a saved card, perform the following setup steps:

1. Click **Navigator > My Enterprise > Setup and Maintenance**.
2. In the Setup and Maintenance work area, go to the **Manage Standard Lookups** task:
3. Developer Opt-in setup
 - a. Set the following lookup type and code to enable the CVV feature.
 - i. Lookup Type: ORA_IBY_CONTROLLED_FEATURES
 - ii. Lookup Code: IBY_FEATURE_FIN932_ON
 - iii. Select the **Enabled** check box.

Two-Factor Authentication During Token Creation

Users can enable the hosted payment page to perform two-factor authentication using a one-time password (OTP) while creating tokens. This is accomplished by combining a near-zero-amount payment (sale) transaction with token creation. This scenario applies when two-factor authentication applies to the merchant country.

CyberSource redirects the hosted payment page to the issuer. The issuer in turn displays a page to enter the cardholder's PIN or one-time password.

Users should be able to enable two-factor authentication for customer-initiated transactions for external users in Bill Management. They should also be able to use the payment system account settings to skip two-factor authentication for internal users in Receivables, Collections, and Order Management.

If users need cardholder to perform two-factor authentication for every transaction, they can enable single use token option. In this case, token created by user can be used for only single transaction and doesn't appear in the LOV. Therefore, cardholder need to perform token creation every time.

The following parameters have been predefined to enable two-factor authentication and single use token.

Payment System Account Settings

SETTING NAME	SETTING CODE	ATTRIBUTE TYPE	DEFAULT VALUE	RECOMMENDATION
Cardholder Authentication During Token Creation	TOKEN_2FA	LOV (Null, No, External User, Any User) - Null - No - No - Don't perform OTP - External User - Perform OTP only for External Users - Any User - Perform OTP for External or Internal Users	Null	Select External User to enable two-factor authentication for Bill Management users.
Cardholder Authentication Amount	TOKEN_2FA_AMOUNT	Number (Value should be between 0 to 1)	Null	Enter 0.01 or 0.1 or 1 based on the strength of the currency.
Single Use Token	SINGLE_USE_TOKEN	- Null - No - External User - Any User	Null	Enter External User to perform token creation every time.

Lookup

- Lookup Type: **ORA_IBY_TOKEN_OTP**
- Meaning: **Token Two-Factor Authentication**
- Description: **Two-factor authentication during token creation.**

This lookup has the following lookup codes.

LOOKUP CODE	MEANING	DESCRIPTION
NO	No	Authentication not required.
EXT	External User	Authentication is required for external user.
ANY	Any User	Authentication is required for external or internal user.

These settings are available ready-to-use for CyberSource.

Transaction Flow

This section illustrates the end-to-end flow of a credit card payment process starting with the invoice creation.

Credit Card Creation

1. Login as Receivables User.
2. Click **Navigator > My Enterprise > Setup and Maintenance**.
3. In the Setup and Maintenance work area, go to the **Manage Customers** task.
 - Offering: Financials
 - Functional Area: Customer Payments
 - Task: Manage Customers
4. Search for your customer.
